

ACC 3201

PC AT/XT Floppy Disk Formatter/Controller

- Compatible with IBM* PC/AT and XT* disk drive systems
- Supports 360K/720K/1.2M/1.44M formats
- Supports up to four 3.5" or 5.25" floppy disk drives
- Emulates the NEC765A in an IBM PC environment
- Built-in handshaking signals to operate in either DMA or non-DMA mode
- Supports variable write precompensation with track select
- Built-in address mark detection circuitry to simplify read electronics
- IBM PC system address decoder
- On-chip digital data separator eliminates critical analog adjustments
- Data rates of 250, 300 and 500 Kbits (will support higher data rates by using higher clock rates)
- Programmable data record length, 256, 512 or 1024 bytes/sector
- Multisector and multitrack transfer
- Flexible data scan capability, single sector or the entire track
- 16-bit half cell divide algorithm reduces soft error rates
- Direct high current drive output
- Single 24 MHz crystal input
- Programmable 3F0 read only port
- 1.5 micron high performance CMOS technology
- 68-L PLCC package

* Trademarks of International Business Machines

General Description

The ACC 3201 is a high performance CMOS single-chip floppy disk controller. With the ACC 3201, designers can build an IBM PC/XT or AT compatible Floppy Disk Drive with fast access time, high reliability and low cost per bit capability. The ACC 3201 integrates the functions of a standard floppy disk drive controller.

Data separator
Write precompensation circuit
Decode logic
Data rate selection
Clock generation
Drive interface drivers and receivers.

This integration greatly reduces the number of components required to interface floppy disk drives to a microprocessor system.

The ACC 3201 supports up to four floppy disk drives. It is compatible with IBM System 34 double density format (MFM), and Sony EMCA format.

The ACC 3201 contains the decode logic for the internal registers, the write logic and the read logic. The system address decoder is compatible with the IBM PC drive system. Handshaking signals are provided to make DMA operation easy to incorporate with the aid

of an external DMA control chip. The ACC 3201 operates in either DMA or Non-DMA modes. In the Non-DMA mode, the ACC 3201 generates interrupts to the processor each time a data byte is available. In DMA mode, the processor only needs to load the command into the ACC 3201 which will control all data transfers.

The Data Separator in the ACC 3201 minimizes read error rates for high performance floppy disk drives. The on-chip phase locked loop digital circuit adjusts the clock used during data read to keep it in phase with the data signal. Write precompensation is included in addition to the formatting, encoding/decoding, stepper motor control, and status sensing functions. All inputs are TTL compatible, and outputs are high current, open drain with direct drive interface.

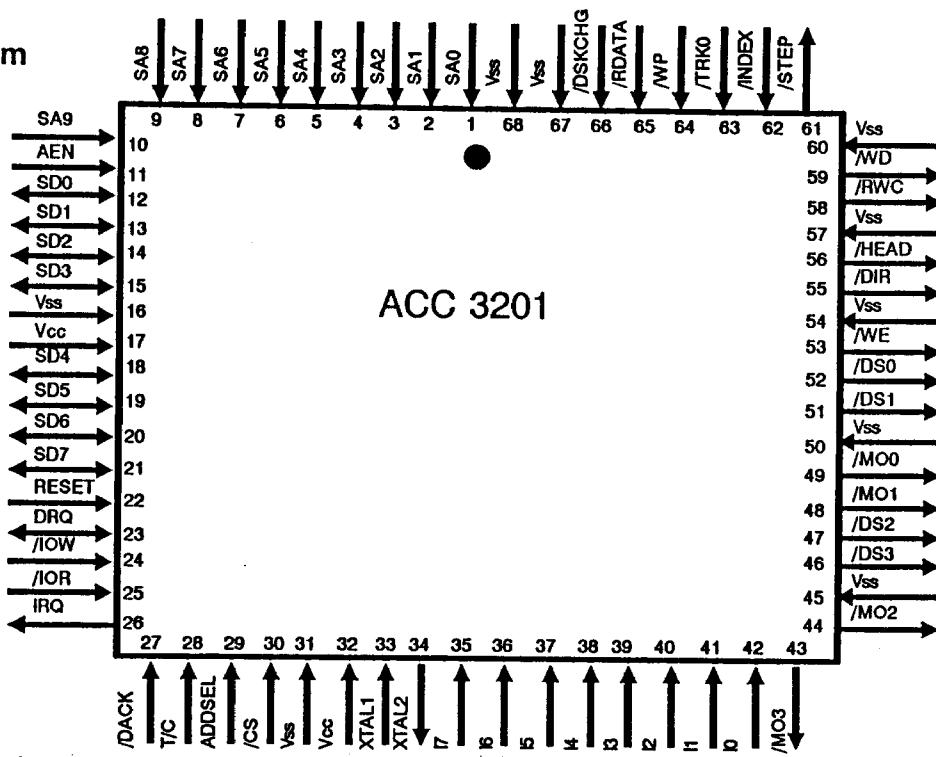

Using a single 24 MHz crystal input, the ACC 3201's internal Clock Generation circuit provides all timing signals for the sampling clock, write clock, and master clock. It

generates 8 and 4 MHz to handle standard data rates of 500 and 250 Kb/s and 4.8 MHz to support a 300 Kb/s data rate. This chip will support higher data rates by using higher frequency crystal inputs.

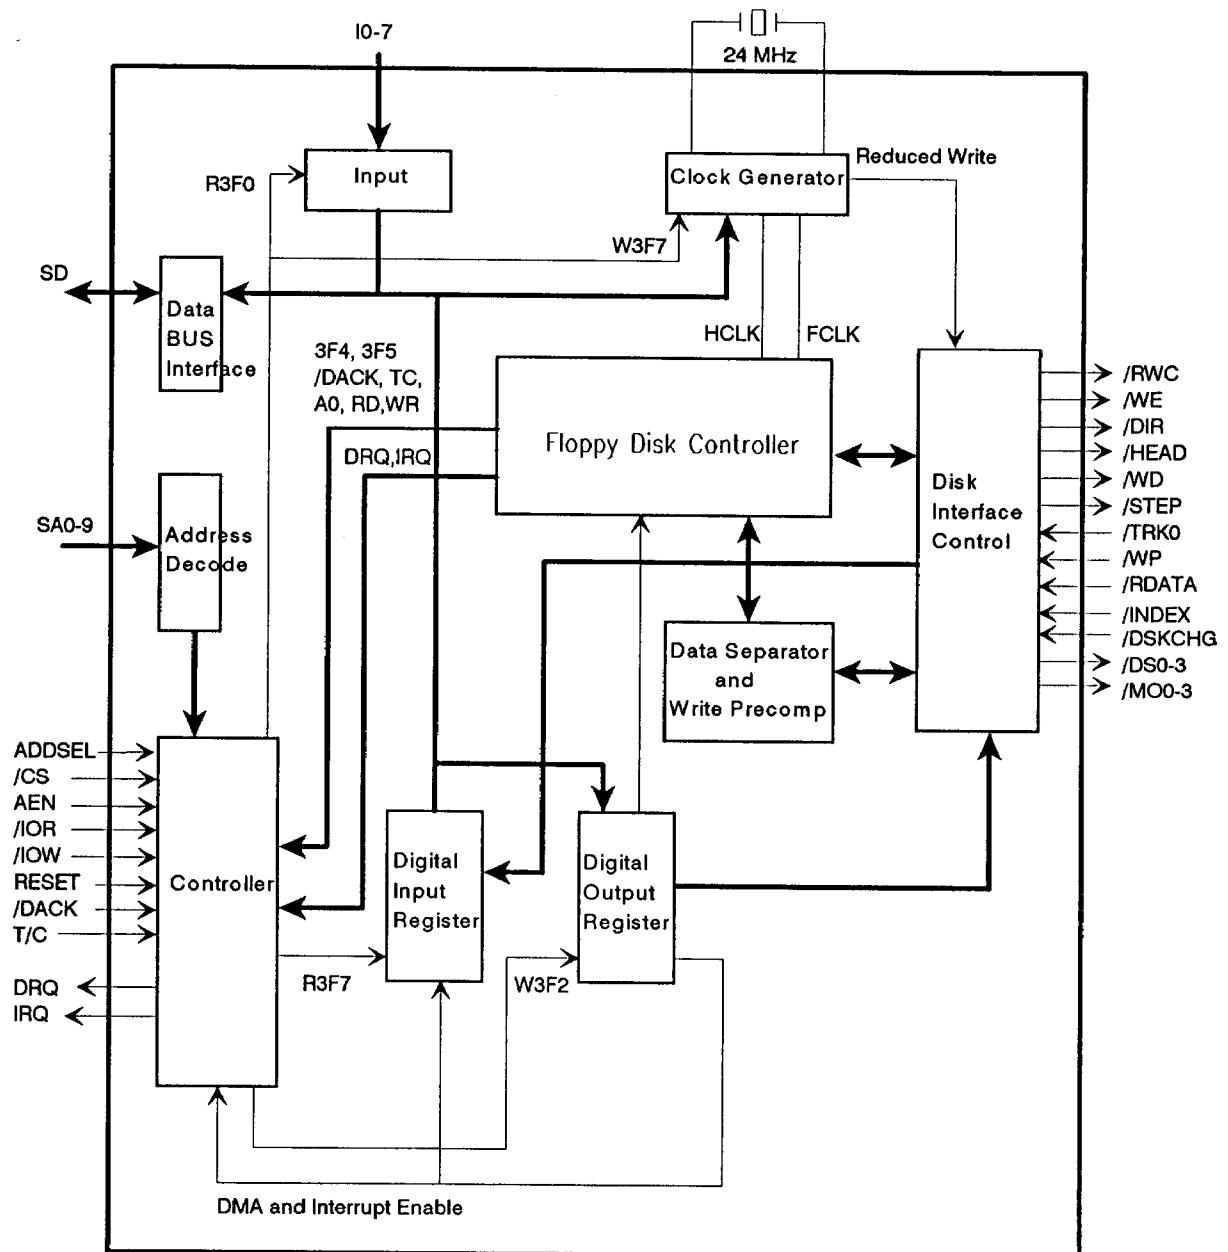

The ACC 3201 executes the following fifteen commands from the microprocessor.

- Read Data
- Read Deleted Data
- Read a Track
- Read ID
- Write Data
- Write Deleted Data
- Format a Track
- Scan Equal
- Scan Low or Equal
- Scan High or Equal
- Recalibrate
- Sense Interrupt Status
- Specify
- Sense Drive Status
- Seek

Typical Application (4 Drives)

Pin Descriptions

Symbol	Pin	I/O	Pin Description
SA0	1	I	Address bus.
SA1	2		
SA2	3		
SA3	4		
SA4	5		
SA5	6		
SA6	7		
SA7	8		
SA8	9		
SA9	10		
AEN	11	I	Address enable. Input from DMA controller. When this line is active, the DMA controller has control of the address bus.
SD0	12	I/O	Data bus.
SD1	13		
SD2	14		
SD3	15		
SD4	18		
SD5	19		
SD6	20		
SD7	21		
RESET	22	I	Active high input that resets the controller to the idle state. Resets all the output lines to the floppy disk drive to their disabled states.
DRQ	23	O	DMA request by FDC when DRQ=1.
/IOW	24	I	Command from the processor to transfer data from the SD bus to the FDC,
/IOR	25	I	Command from the processor to transfer data from the chip to the SD bus.
IRQ	26	O	Interrupt request generated when IRQ=1.
/DACK	27	I	When set to 0, a DMA cycle is active and the controller performs a DMA transfer.
T/C	28	I	When set to 1, terminates data transfer during Read/Write/Scan commands in DMA or interrupt mode.

Pin Descriptions

Symbol	Pin	I/O	Pin Description
ADDSEL	29	I	Address select. When set to 1, SA=3FX. When set to 0, SA=37X
/CS	30	I	Chip Select. When set to 0, FDC is selected,
XTAL1	33	I	XTAL oscillator input.
XTAL2	34	O	XTAL oscillator output.
I7	35	I	Reserved 8-bit read only register from 3F0.
I6	36		
I5	37		
I4	38		
I3	39		
I2	40		
I1	41		
I0	42		
/MO3	43	O	When set to 0, the MOTOR ON enables the disk drive. This is an open drain output.
/MO2	44		
/MO1	48		
/MO0	49		
/DS3	46	O	When set to 0, the drive select enables the disk drive. This signal is an open drain output.
/DS2	47		
/DS1	51		
/DS0	52		
/WE	53	O	Write Enable. When set to 0, causes a write from the microprocessor to the floppy disk drive. An open drain output.
/DIR	55	O	Direction of the head stepper motor. An open drain output. Logic 1 = outward motion. Logic 0 = inward motion.
/HEAD	56	O	Head select. Open drain output. Determines which disk drive head is active. Logic 1 = Side 0. Logic 0 = Side 1.
/RWC	58	O	Reduced write current. This signal can be used on two-speed disk drives to select the transfer rate. Logic 0 = 250KB/s. Logic 1 = 500KB/s. An open drain output.

Pin Descriptions

Symbol	Pin	I/O	Pin Description
/WD	59	O	Write Data. Logic low open drain. Writes precompensated serial data to the selected FDD. An OD output.
/STEP	61	O	STEP output pulses. Active low open drain output. Produces a pulse at a programmable rate to move the head to another cylinder.
/INDEX	62	I	Active low Schmitt input from the disk drive. Senses the head positioning over the beginning of a track marked by an index hole.
/TRK0	63	I	Track 00. Active low schmitt input from the disk drive. Signals that the head is positioned over the outermost track.
/WP	64	I	Write Protected. Active low schmitt input from the disk drive indicates that the diskette is write protected.
/RDATA	65	I	Read data input. Signals a read from the FDD to the microprocessor.
/DSKCHG	66	I	Diskette change. This signal is active low at power-on and when the diskette is removed. It remains active until a /step pulse is received with the diskette in place.
VCC	17, 32		+5 volt supply
VSS	16, 31, 45, 50, 54, 57, 60, 67, 68		Ground

Register Descriptions

There are six registers in the ACC 3201, three registers for the status of signals used in diskette operations, one for data register, and two controller registers. The I/O addresses of these registers are described in the tables below.

Address		Registers	
Primary (ADDSEL=1)	Secondary (ADDSEL=0)	READ	WRITE
3F0	370	Input register	
3F2	372		Digital output register
3F4	374	Main status register	
3F5	375	Data register	Data register
3F7	377	Digital input register	Diskette control register

Input Register
(HEX 3F0) (8-bits) (R)

The Input Register is a general purpose input register.

Bit	Function
7	I7
6	I6
5	I5
4	I4
3	I3
2	I2
1	I1
0	I0

Digital Output Register
(HEX 3F2) (8-bits) (W)

The Digital Output Register controls drive motors, drive selection, and feature enable. All bits are cleared by the I/O reset line.

Bit	Function
7	Motor Enable 3
6	Motor Enable 2
5	Motor Enable 1
4	Motor Enable 0
3	DMA and Interrupt Enable
2	/Floppy Disk Controller reset
1,0	Drive Select 0 through 3 00 selects drive 0 01 selects drive 1 10 selects drive 2 11 selects drive 3

Main Status Register
(HEX 3F4) (8) (R)

The main status register controls data flow between the microprocessor and the controller.

Bit	Function
7	Request for Master 1 Data Register ready for transfer
6	Data Input/Output 1 Data transfer from Controller 0 Data transfer from the SD BUS
5	Execution Mode (Non-DMA mode) 1 Execution
4	Controller Busy 1 Controller busy
3	Drive 3 Busy 1 Diskette 3 in seek mode Drive 3 busy
2	Drive 2 Busy 1 Diskette 2 in seek mode Drive 2 Busy
1	Drive 1 Busy 1 Diskette 1 in the seek mode Drive 1 Busy
0	Drive 0 Busy 1 Diskette 0 in the seek mode Drive 0 Busy

Data Register
(HEX 3F5) (8) (R/W)

The Data Register consists of four status registers in a stack. Only one register is presented to the data bus at a time. It stores data, commands and parameters, and provides diskette/drive status information. Data bytes are passed through the data register to program or obtain results after a command.

Status Register 0 (ST0)

Bit	Function
7-6	IC (Interrupt Code) 00 Normal termination of command 01 Abnormal termination of command 10 Invalid command issue 11 Abnormal termination because the ready signal from FDD changed state during command execution
5	SE, seek end 1 seek end
4	EC (Equipment Check) 1 When a fault signal is received from the FDD, or the track 0 signal fails to occur after 77 step pulses 0 No error
3	NR (Not Ready) 1 Drive is not ready 0 Drive is ready
2	HD (Head address) 1 Head 1 select 0 Head 0 select
1-0	US1,US0. Drive select 00 Drive 0 select 01 Drive 1 select 10 Drive 2 select 11 Drive 3 select

Status Register 1 (ST1)

Bit	Function
7	EN (End of Cylinder) 1 When the FDC tries to access a sector beyond the final sector of a cylinder.
6	Not used. This bit is always 0.
5	DE (Data Error) 1 When the FDC detects a CRC error in either the ID field or data field.
4	OR (Over Run) 1 IF the FDC is not serviced by the host system during data transfer within a certain time interval
3	Not used. This bit is always 0.
2	ND (No Data) 1 During execution of Read, Write or Verify Data if the specified sector cannot be found.
1	NW (Not Writable) 1 Set if the "write Protect" signal is detected from the diskette drive during the execution of Write Data.
0	Missing Address Mark 1 When the FDC cannot detect the data address mark or deleted data address mark

Status Register 2 (ST2)

Bit	Function
7	Not used. This bit is always 0
6	CM (Control Mark) 1 If deleted data is encountered during execution of the Read Data or Scan command.
5	DD (Data Error in Data Field) 1 If the FDC detects a CRC error in the data field.
4	WC (Wrong Cylinder) 1 Wrong Cylinder
3	SH (Scan Equal Hit) 1 During execution of the Scan command, if the condition "equal" is satisfied.
2	SN (Scan Not Satisfied) 1 During execution of the Scan command if FDC cannot find a sector.
1	BC (Bad Cylinder) 1 Bad Cylinder
0	MD (Missing Address Mark in Data Field) 1 When data is read from the medium, if the FDC cannot find a data address mark or deleted data address mark.

Status Register 3 (ST3)

Bit	Function
7	FT, Fault
6	WP, Write Protected
5	RY, Ready
4	T0, Track 0
3	TS, Two-Side
2	HD, Head Address
1	US1, Unit Select 1
0	US0, Unit Select 0

Digital Input Register
(HEX 3F7) (R)

The Digital Input Register is for diagnostic purposes.

Bit	Function
7	Diskette Change (DSKCHG)
6	Tri-State
5	Tri-State
4	Tri-State
3	Tri-State
2	Tri-State
1	Tri-State
0	Tri-State

Diskette Control Register
(HEX 3F7) (W)

The Diskette Control Register sets the precompensation.

Bit	Function
7-2	Reserved
1,0	Transfer Rates Select and Reduced Write Current Control
00	500 Kb/s /RWC=1
01	300 Kb/s /RWC=0
10	250 Kb/s /RWC=0
11	Reserved

Commands

The ACC 3201 diskette controller is capable of performing fifteen commands. Each command is initiated by a multi-byte transfer from the microprocessor. The result can also be a multi-byte transfer back to the microprocessor. Each command consists of three phases: Command, Execution, and Result.

Command

The microprocessor issues all required information to the controller to perform a specific operation.

Execution

The controller performs the specified operation.

Result

After completing the operation, status information and other housekeeping information are made available to the microprocessor.

Command Symbol Descriptions

A0	Address Line 0 A0 controls the selection of main status register (A0=0) or data register (A0=1).
C	Cylinder Number Current or selected cylinder (track), numbers 0 through 76.
D	Data Data pattern to be written into a sector.
D₇ - D₀	Data Bus 8 bit data bus, where D7 stand for the most significant bit, and D0 stands for the least significant bit.
DTL	Data Length The value of this byte is normally ignored by the controller. However a byte must be written at this location.
EOT	End of Track The final sector number on a cylinder.
GPL	Gap Length The length of gap 3. During Read/Write commands this value determines the number of bytes that VCO sync keeps low after two CRC bytes. During Format command it determines the size of gap 3.
H	Head Address Head number 0 or 1, as specified in the ID field.
HD	Head Selected head number 0 or 1. (H=HD in all commands)
HLT	Head Load Time The head load time in the selected FDD (2 to 254 ms in 2 ms increments.)
HUT	Head Unload Time Time after a Read or Write operation. (16 to 240 ms in 16 ms increments).

MF	FM or MFM Mode Must be 1 to select MFM mode.	ST0-ST3 Status 0-Status 3 One of the four registers that store status information after a command has been executed. This information is available during the result phase after command execution. These registers must not be confused with the main status register (selected by A0=0). ST0-ST3 are read only after a command has been executed and only if they contain information relevant to the command.
MT	Multitrack If MT is high, a multitrack operation is performed. If MT=1 after finishing a read/write operation on side 0, FDC automatically starts searching for sector 1 on side 1.	
N	Number The number of data bytes written in a sector.	
NCN	New Cylinder Number New cylinder number reached as a result of the seek operation; desired position of head.	STP Scan Test If STP=1 during a scan operation, the data in contiguous sectors is compared byte by byte with data sent from the processor (or DMA). If STP=2, alternate sectors are read and compared.
ND	Non-DMA Mode	
PCN	Present Cylinder Number Cylinder number at the completion of the Sense Interrupt Status command, current position of the head.	US0-1 Unit Select Selected drive number 0 or 1.
R	Record The sector number to be read or written.	
R/W	Read/Write Either a Read or Write signal.	
SC	Sector Number of sectors per cylinder.	
SK	Skip Skip deleted data address mark.	
SRT	Stepping Rate These bits indicate the stepping rate for the FDD (1 to 16 ms in 1 ms increments). Stepping rate applies to all drives (FH=1ms, EH=2 ms, etc.).	

COMMAND FORMAT

The following commands can be issued to the controller. An "x" indicates a "don't care" condition.

READ DATA

Command Phase

7	6	5	4	3	2	1	0

Input Leakage Current	I_{IL}	-64	-250	uA	
Negative-going Threshold	V_t	0.2VCC		V	
Positive-going Threshold	V_{t+}		0.8VCC	V	
Input Hysteresis	V_H	1.0		V	

/MO0-3, /DS0-3, /RWC, /DIR, /STEP, /WD, /WE, /HEAD

Parameter	Symbol	Min	Max	Unit	Test Conditions
Output Low Voltage	V_{OLD}		0.4	V	$I_{OL}=40\text{mA}$
Output High Leakage	I_{LOH}		10	uA	$V_{OUT} = Vcc$

ADDSEL, IO-7

Parameter	Symbol	Min	Max	Unit	Test Conditions
Input Low Voltage	V_{IL}		0.8	V	
Input High Voltage	V_{IH}	2.0		V	
Input Low Current	I_{IL}	-64	-250	uA	

XTAL1

Parameter	Symbol	Min	Max	Unit	Test Conditions
Input Low Voltage	V_{IL}		1.0	V	
Input High Voltage	V_{IH}	4.0		V	
Input Low Current	I_{IL}		-1.0	uA	
Input high Current	I_{IH}		1.0	uA	

XTAL2

Parameter	Symbol	Min	Max	Unit	Test Conditions
Output Low Voltage	V_{OL}		0.4	V	$I_{OL}=0.28 \text{ mA}$
Output High Voltage	V_{OH}	2.4			$I_{OH}=-1.4 \text{ mA}$

AC Specifications

Data rate = 500/300/250 Kb/sec

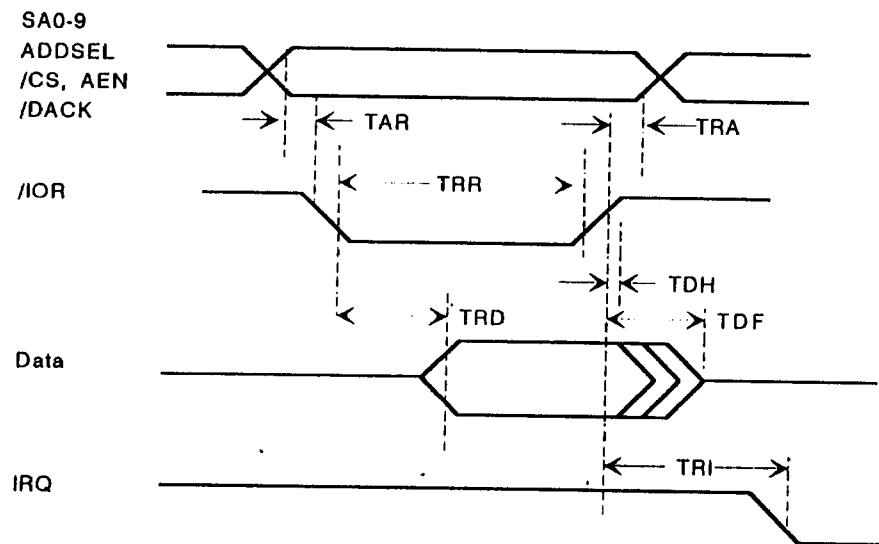

Parameter	Symbol	Min	Typ(2)	Max	Unit	Conditions
SA9-0, ADDSEL, AEN, /DACK, /CS setup time to /IOR falling edge	TAR	25			ns	
SA9-0, ADDSEL, AEN, /DACK, /CS hold time from /IOR rising edge	TRA	0			ns	
/IOR width	TRR	80			ns	
Data access time from /IOR falling edge	TRD			80	ns	CL = 100pf
Data hold from /IOR rising edge	TDH	10			ns	CL = 100pf
SD to float from /IOR rising edge	TDF	10		50	ns	CL = 100pf
IRQ delay from /IOR rising edge	TRI			360/570/675	ns	
SA9-0, ADDSEL, AEN, /DACK, /CS setup time to /IOW falling edge	TAW	25			ns	
SA9-0, ADDSEL, AEN, /DACK, /CS hold time from /IOW rising edge	TWA	0			ns	
/IOW width	TWW	60			ns	
Data setup time to /IOW rising edge	TDW	60			ns	
Data hold time from /IOW rising edge	TWD	0			ns	
IRQ delay from /IOW rising edge	TWI			360/570/675	ns	

Parameter	Symbol	Min	Typ(2)	Max	Unit	Conditions
/DRQ cycle time	TMCY	27			us	
DRQ delay time from /DACK falling edge	TAM			50	ns	
DRQ to /DACK delay	TMA	0			ns	
DACK width	TAA	260/430/510			ns	
/IOR delay from /DRQ	TMR	0			ns	
/IOW delay from /DRQ	TMW	0			ns	
/IOW or /IOR response time from DRQ	TMRW			12/20/24	us	
TC Width	TTC	135/220/260			ns	
RESET Width	TRST	1.8/3/3.5			us	
/INDEX Width	TIDX	0.5/0.9/1.0			us	
/DIR setup time to /STEP	TDST	1.0/1.6/2.0			us	
/DIR hold time from /STEP	TSTD	24/40/48.0			us	
/STEP pulse width	TSTP	6.8/11.5/13.8			us	
			7/11.7/14			
				7.2/11.9/14.2		
/STEP cycle time	TSC	(3)	(3)	(3)	us	
/WD pulse width	TWDD	100/185/225			ns	
			125/210/250			
				150/235/275		
Write Precompensation time		100/185/225			ns	
			125/210/250			
				150/235/275		

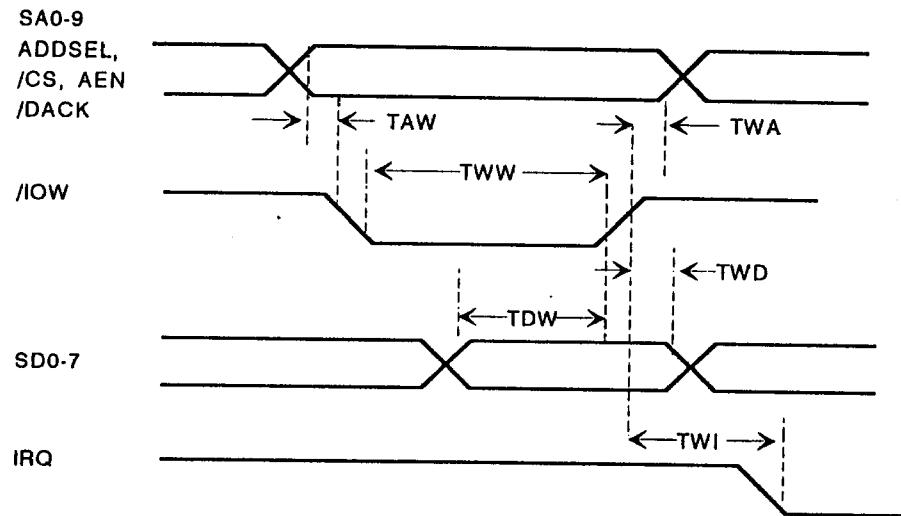

(2) Typical values for T = 25° C and nominal supply voltage.

(3) Programmable from 2ms through 32ms in 2ms increments.

Production Package Specification

Package: 68-pin PLCC

Unit: inches

Chip: ACC 3201

ACC
Microelectronics Corporation

3295 Scott Blvd.
